Issued: 1 / 1957

I.T. DJATLOV and L.N. ROZENCVEJG (in connection with work carried out by the physical department of the physical-mathematical faculty of Charkov of the State University "A.M. GOR'KIJ", No 6, 81 (1955)) showed that scattered protons are partly polarized, and they computed curves for the dependence of polarization P on the energy of the protons at different scattering angles. The present report deals with the experimental examination of these results, and furthermore the correctness of the phase analysis by H.L. JACKSON and A.I. GALONSKIJ, Phys. Rev. 89, 370 (1953) is checked. The apparatus used for measuring the degree of polarization P is discussed on the basis of a drawing. The protons, which are accelerated by means of an electrostatic generator, pass through a system of collimator openings and then impinge upon a solid carbon target. The amperage of the primary bundle is measured by means of a FARADAY cylinder and a current integrator. The scattered protons then impinge on an analyzer filled with helium (40 cm mercury column). The protons scattered by He^4 can then impinge on two proportionality counters. The rather powerful analyzer can indicate the polarization of proton bundles with the intensity of 10^4 proton/sec. The formula for azimuthal asymmetry is given. For the intensity ratio at $\varphi = 0^\circ$ and at $\varphi = 180^\circ$ it applies that

Dokl.Akad.Nauk, 111, fasc. 1, 82-84 (1956) CARD 2 / 2 PA - 1744

$R = (1 - PP_{\text{eff}})/(1 + PP_{\text{eff}})$. Here P denotes the polarization of the protons which are elastically scattered by C^{12} nuclei, P_{eff} - effective value of the polarization of protons scattered in the helium analyzer, φ - the angle between the normals on the planes of the first and second scattering. For the elimination of asymmetry resulting from the difference in the degree of efficiency of the two detectors, the places of the counters were interchanged in the course of the test. The geometric mean value for the two positions of the counters was assumed as the amount of the asymmetry R . Because of the unfavorable geometric position of the analyzer the computation of P_{eff} would be tedious and complicated. For this reason P_{eff} was here determined from an experiment dealing with the twofold scattering of the protons by He^4 . The value of P_{eff} found in this manner is represented in a diagram as a function of the energy with which the protons impinge upon the foil of the analyzer. This curve then served the purpose of determining the degree of polarization of the protons which were elastically scattered by C^{12} nuclei. The values thus obtained for polarization are shown in form of a diagram for the angle of 60° in the center of mass system. Agreement of experimental with theoretical data confirms the results of the phase analysis by H.L.JACKSON et al.

Title : Measurement of the Effective Cross Sections of the Reactions $C^{12}(p, \gamma)$ and $C^{12}(d, n)$ in the Region of Small Energies of Bombarding Particles.

Orig Pub : Zh. eksperim. i teor. fiziki, 1956, 32, No 2, 251-255

Abstract : An investigation is made of the reactions $C^{12}(p, \gamma)$, N^{13} and $C^{12}(d, n)N^{13}$ in the energy range of bombarding particles of 300 -- 400 kev. The β^+ activity of N^{13} was recorded with the aid of a vacuum tube electrometer. The resulting values of the yields of the reactions with thick targets in the investigated energy range are in good agreement with the course of the analogous curves at energies above 400 kev.

(Izmereniye effektivnykh poperechnykh secheniy reaktsiy $C^{12}(p,\gamma)$ i $C^{12}(d,n)$ v oblasti nalykh energiy bombardiruyushchikh chastits. - Russian)
Zhurnal Eksperim. i Teoret.Fiziki, 1957, Vol 32, Nr 2, pp 251-255 (USSR)
Received 5/1957 Reviewed 6/1957

ABSTRACT

It is the object of the present work to determine the effective cross sections of the reactions $C^{12}+H^1 \rightarrow N^{13}+\gamma$ (1) and $C^{12}+H^2 \rightarrow N^{13}+n+\gamma$ (2). When studying the reaction (1) it was of interest to compare the experimentally obtained effective cross sections with those obtained by means of the extrapolation formula.

Apparatus: Protons and Deuterons were accelerated by means of the electrostatic generator of the Physical-Technical Institute of the Academy of Science of the Ukrainian SSR. Tests were carried out on atomic and molecular bundles of hydrogen and deuterium. Experiments discussed here are based upon the quantitative determination of the β -active product accumulated in the target of the reaction. Thick targets of natural carbon were used. The experimental order is discussed on the basis of a drawing.

Measuring of Cross Sections: For the yield of the reactions investigated here a formula is given. Two diagrams illustrate the curves of the yields of both reactions. Here the ordinate axis is plotted on the yield, i.e. the number of positrons per particle which impinge on the target. The abscissa axis characterized the energy of the impinging particles in keV.

Card 1/2

Measurement of the $C^{12}(p,\gamma)$ and $C^{12}(d,n)$ Effective Cross Sections PA-2668
For Low Energy Bombarding Particles.

The cross section was determined from the curves of the yield and is represented by the well-known formula $\sigma = (dy/dE)(dE/dx)/n$. Here dE/dx denotes the loss of energy of the bombarded particle in the target, y - the yield of the reaction, n - the yield curve. The cross section of the reaction $C^{12}(p,\gamma)$ amounts to $0,30 \cdot 10^{-30}$ At 313 keV and at 358 keV increases to $6,4 \cdot 10^{-30} \text{ cm}^2$. The cross section of the reaction $C^{12}(d,n)$ amounts to $0,8 \cdot 10^{-28} \text{ cm}^2$ at 340 MeV.

TITLE: Elastic Scattering of Protons on Si^{28} Nuclei. Spin and Parity
of the Levels of 4,31 and 4,73 MeV of the P^{29} Nucleus (Uprugoye
rasseyaniye protonov yadrami Si^{28} . Spin i chetnost' urovney
4,31 i 4,73 MeV yadra P^{29})

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya fizicheskaya, 1958,
Vol. 22, Nr 7, pp. 871 - 876 (USSR)

ABSTRACT: The scattering cross-section of the reaction $p - \text{Si}^{28}$ was
measured in order to establish the characteristics of the
excited states of the P^{29} nucleus. These states are connected
with the resonance mentioned in reference 1. The method of
measurement is described first. The proton beam was accelerated
in the electrostatic generator of the Physical-Technical In-
stitute of the AS Ukr SSSR. It is deflected by 90° by a magnetic
analyzer. It then passes through a system of collimating dia-
phragms with a diameter of 2 mm and strikes a silicon target.
From the qualitative analysis it is ascertained, that the level
of 4,31 MeV can have a spin and a parity of $3/2^-$ or $1/2^-$. The

Card 1/3

Elastic Scattering of Protons on Si^{28} Nuclei. Spin and Parity of the Levels of 4,31 and 4,73 MeV of the p^{29} Nucleus SOV/48-22-7-22/26

determination of the spin and the parity for the level of $1/2^+$ with 4,73 MeV is beyond doubt. For a final determination of the spin of the 4,31 level the computed curves were compared with the experimental results. In order to compute the scattering cross-section of the reaction $\text{p} + \text{Si}^{28}$ in the range from 1,6 to 2,2 MeV data from reference 5 were used. The cross-section was computed according to formulae (1), (2) and (3) without assuming a dependence of the phases on the energy. The maximum divergence between the experimental points and the computed curves did not exceed 25%. As a summary it is stated, that the resonance half-widths found experimentally, 50 and 14 keV, differ considerably from the values found in reference 1, 60 and 25 keV. The results of the phase analysis are exposed. The ratio of the given level-widths and the quantity

$\frac{3\hbar^2}{2ma}$ shows that the level of 4,31 MeV apparently is a single-stage level whereas the 4,73 MeV level is connected with a much more complicated mechanism of excitation. The evidence

(Polyarizatsiya protonov, uprugo rasseyannykh yadrami Si^{28})

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol 35,
Nr 6, pp 1386-1390 (USSR)

ABSTRACT: In the introduction, some papers dealing with p- Si^{28} scattering are discussed in short and some results are mentioned. (Ref 1: Scattering cross section at $E_p = 1.65$ and 2.09 Mev (resonance), with breadths of ~ 60 and ~ 25 kev, broad resonance also at 2.5 Mev; Ref 2 (Val'ter et al.): Measurements of elastic scattering cross sections at $E_p = 1.5$ to 3.1 Mev, results in table 1; Ref 3: Survey of spin and parity of the 4.31 Mev level, in agreement with the results of Ref 2). The next paragraph of this paper deals theoretically with the calculation of the polarization $\vec{P} = P(\theta, E)\vec{n}$, $\vec{n} = [\vec{k}\vec{k}]/|\vec{k}\vec{k}|$, according to formulae given in references 4 and 5.

Card 1/3

In the following chapter the results obtained by polarization measurements are published. Apparatus and method are described by

SOV/56-35-6-10/44

The Polarization of Protons Elastically Scattered on Si^{28} Nuclei

references 6 and 7. The experiments were carried out on the electrostatic generator of the PTI AN USSR (Physico-Technical Institute, AS UkrSSR). Results are given by table 2, viz. for the scattering angles θ (in the center of mass system) of 60° and 90° for the following E_p -values: 1.7, 1.75, 1.8, 1.85, 2.0, 2.05, 2.10, 2.15. The experimentally determined polarization values agree with calculated values (which are also given by this table) within the error limits. The functions $P(E_p)$ are given in form of diagrams in figure 1 (for $\theta = 60^\circ$) and in figure 2 (for $\theta = 90^\circ$); a second ordinate shows the corresponding cross sections $\sigma(E_p)$, which were obtained as the results of a phase shift analysis. Two fully analogous diagrams are shown by figures 3 and 4, viz. for $\theta = 125^\circ$ and 150° respectively. There follows a short discussion of results. There are 4 figures, 2 tables, and 7 references, 3 of which are Soviet.

TITLE: Measurement of Proton Polarization by Means of a Helium Analyzer

PERIODICAL: Uch. zap. Khar'kovsk. un-t, 1958, Vol 98, Tr. Fiz. otd. fiz.-matem. fak., Vol 7, pp 119 - 135

ABSTRACT: The authors describe the development of an instrument for measuring the polarization of protons that have been elastically scattered by nuclei. The instrument consists of a scattering chamber and a helium analyzer. Owing to its large "aperture ratio", the instrument can be utilized to measure the polarization of low-intensity beams (10^4 protons/sec). Experiments in double proton-He⁴ scattering, as well as measurements of the polarization of protons elastically scattered by Cl³⁵ nuclei, have shown that the instrument permits the measurement of polarization degrees in excess of 3 to 5% for protons resulting from reactions with a cross section of 10^{-25} cm² . sterad⁻¹. The reactions in question occur in targets containing 10^{19} nuclei/cm² at a primary current of 1 μ amp.

TITLE:

The Determination of Absolute Cross Sections for $B^{10}(p, \gamma)$ and $B^{10}(d, n)$ Reactions

PERIODICAL:

Uch. zap. Khar'kovsk. un-t, 1958, Vol 98, Tr. Fiz. otd. fiz.-matem. fak., Vol 7, pp 163 - 170

ABSTRACT:

In order to obtain more precise information concerning the levels of the C^{11} nucleus, the authors, through the positron activity of C^{11} nuclei, studied the absolute effective cross section for a $B^{10}(p, \gamma)$ reaction in the 300 to 1,500 KeV proton energy range and for a $B^{10}(d, n)$ reaction in the 100 to 400 KeV deuteron energy range. A special end-window counter served as positron detector. The targets were bombarded with a proton beam from an electrostatic generator, and it proved possible to turn the target faces toward the counter immediately after irradiation. The measured value of the half-life of C^{11} was equal to 20.6 ± 0.1 min. The authors give the energy dependences of the cross sections for $B^{10}(p, \gamma)$ and $B^{10}(d, n)$ reactions. It can be seen from the excitation curve for

Card 1/2

SOV/58-59-9-19798

The Determination of Absolute Cross Sections for $B^{10}(p, \gamma)$ and $B^{10}(d, n)$ Reactions

the $B^{10}(p, \gamma)$ reaction that extensive resonance exists at $E_p = 1.176$ MeV. Other resonances were not observed in the investigated range. Accuracy in cross-section measurement amounts to 20% at energies of 300 to 600 KeV and attains 10% in the region of resonance. When $E_d = 230$ KeV, there is a maximum in the cross section for the $B^{10}(d, n)$ reaction. The absolute value of the effective cross section at resonance amounts to $2.68 \cdot 10^{-28} \text{ cm}^2$ with an accuracy approaching $\pm 10\%$. On the basis of these data, the value of the resonance-level energy of C^{11} was computed to be 25.345 MeV.

The Elastic Scattering and the Radiation Capture of Protons by
 $g^{16}\text{Li}$ nuclei (Sprazhnye rasseyaniye i radiatsionnyy ukhvat
protonov yadrom $g^{16}\text{Li}$)

RESEARCH

Investition Akademii nauk SSSR, Seriya fizicheskaya, 1955,
Vol. 23, No. 7, pp. 939-945 (RUS)

Abstract

It is pointed out in the introduction that the investigations of
the elastic scattering of the protons by $g^{16}\text{Li}$ nuclei were carried
out by studying the levels of the $g^{16}\text{Li}$ nuclei, and a number of
papers (Refs. 1-7) are pointed out in this connection. In another
paper (Ref. 8), the reaction $g^{16}\text{Li}(p, \gamma)$ was investigated, and the
results of these papers are shown in 2 diagrams (Figs. 2 and 3).
In the present paper, the elastic scattering of protons is
investigated in the energy range of 1.7 - 3.5 MeV. The measuring
instrument used in these investigations is shown in Figure 1,
and the proton beam was generated by the electrostatic generator

Card 1/3

The elastic scattering of protons by $g^{16}\text{Li}$ nuclei was measured under the angles 34, 40,
44 and 134°, and the results are shown in diagrams (Figs. 1-4).
The curves $\sigma(\theta)$ show six narrow resonances and one wide
resonance at 2.4 MeV. In order to determine the width of the
levels, the value of the resonance energy was accurately
determined. It was investigated that the proton beam is
monochromatic, and the reaction $g^{16}\text{Li}(p, \gamma)$ was studied. An experi-
mental width of resonance of 7.5 keV was measured. The relative
 γ -yield was investigated in the resonance range of 1.8, 2.35
and 2.40 MeV, and the results are shown in 2 diagrams (Figs. 5
and 6). By comparing the widths of the resonances thus obtained
with the corresponding values for the resonances in the elastic
scattering of protons, it becomes clear that the energetic
character of the reaction does practically not depend on the
energy, and that the width of the levels is about 40 keV. This
determines the widths of the levels in the elastic scattering
cross section at 17 and 40 MeV, respectively. The levels of

Card 2/3

The $g^{16}\text{Li}$ nuclei are mentioned in Ref. 8, and it is mentioned
that the results obtained are in good agreement with those
obtained by other authors. The authors thank N. K. Zhurav for
the preparation of the $g^{16}\text{Li}$ -target by the electrostatic
separator, and A. A. Fayzulin and Yu. A. Churikova for the
staff for the operation of the electrostatic generator. There
are 6 figures, 2 tables, and 16 references, 1 of which is Soviet.

TITLE: Elastic Scattering of the Protons by Ar^{40} -Nuclei
(Uprogoye rasseyaniye protonov yadrami Ar^{40})

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959,
Vol 23, Nr 7, pp 846-848 (USSR)

ABSTRACT: In the introduction, it is ascertained that the investigation of the elastic scattering of the protons by Ar^{40} -nuclei is carried out by studying the levels of the K^{41} -nuclei. A non-Russian paper is indicated (Ref 2) in which weak resonances were determined at the energies of 1.9 and 2.48 Mev; the values put forward are, however, considered inaccurate to obtain a survey of the spins and parities of the respective levels. The experiments described in the present paper were carried out with the same instrument as the experiments described in the previous paper of this issue. The elastic scattering cross section was recorded under the angles of 90, 125 and 150° in an energy range of 1.7 to 2.7 Mev. As the diagrams of

Card 1/2

Elastic Scattering of the Protons by Ar^{40} -Nuclei

SOV/48-23-7-13/31

figures 1, 2 and 3 show, two weak resonances can be observed in the elastic scattering cross section at $E_p = 1.86$ and 2.45 Mev, and further a number of resonances at energies over 2.5 Mev. A comparison of the experimental data with the data computed, as well as a determination of the widths of the levels, are not possible. It is further ascertained that the reaction $\text{Ar}^{40}(p,n)\text{K}^{40}$ is only realized by protons with the orbital momentum $l = 3$ or $l = 5$. Finally, the distance of the levels in the K^{41} -nuclei is evaluated, and is indicated with 20 kev at an excitation energy of 10 Mev. There are 3 figures and 6 references, 2 of which are Soviet.

TITLE:

The Elastic Scattering of Protons by Ne^{20} Nuclei

PERIODICAL:

Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1960,
Vol. 24, No. 7, pp. 884-886

TEXT: This paper was read at the 10th All-Union Conference on Nuclear Spectroscopy, which took place from January 19 to January 27, 1960 at Moscow. As a target, gaseous neon (90.5% Ne^{20}) at a pressure of 5 torr was used in the measurements described. The cross section was measured at angles of 55, 90, 125, 141, and 151° in the center-of-mass system. The proton energy was varied in the range of from 1.6 - 3.4 Mev. The heterogeneity of the radiation was ± 8 kev. From the results shown in Figs. 1 and 2, five well-marked resonances may be seen. In the first column of the Table, the proton energies, in the second column the energies of the corresponding Ne^{21} levels, in the third the level widths according to data by Heaberli (Ref. 2) and according to data obtained by the authors are

given. Furthermore, the spins and parities are given. The latter were obtained by a phase shift analysis. As shown by an investigation of the polarization of the protons scattered by Ne^{20} nuclei at an angle of 90° , the polarization in the energy range of from 1 - 1.8 Mev attains 70% (Fig. 3). There are 3 figures, 1 table, and 7 references: 3 Soviet, 3 US, and 1 Dutch.

TITLE:

A Magnetic Spectrometer With Double Focusing

PERIODICAL:

Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1960,
Vol. 24, No. 7, pp. 924-928

TEXT: This is the reproduction of a lecture delivered at the 10th All-
Union Conference on Nuclear Spectroscopy held in Moscow from January 19
to 27, 1960. The spectrometer described here, which has a magnetic field
in sector form, is intended for the study of nuclear reactions brought
about by electrostatic accelerators. Since the energy of the products re-
sulting from the nuclear transformations examined with this spectrometer
do not exceed 8 Mev, it was not necessary for the H_0 to exceed $4 \cdot 10^5$ oe.cm.
A homogeneous field with 15,000 oe was easily attainable in the not very
large gaps. The radius of curvature of the particle path was found to be
320 mm. The distance from the target to the magnetic field entrance is
400 mm, and it is therefore possible to study the distribution of the

nuclear reaction products at an angle of $0 - 150^\circ$. The distance between the photographic state and the point of exit of the particles from the magnetic field is 700 mm. Fig. 2 shows a view of the spectrometer. The magnet core is made of Armco iron, while the water-cooled magnetizing coils are wound on copper bars. The resistance of the coils connected in series is 1.38 ohms, the maximum power consumption is 2.2 kw. The magnetizing current is stabilized to within an accuracy of 0.05%, and the magnetic field can be regulated between 2 and 15 koe. The proton energies which the spectrometer is capable of recording are in the range of 0.2 and 8 Mev. The spectrometer testing is dealt with in great detail. Fig. 3 shows the magnetic field strength as a function of the coil current. Thorough investigations revealed that the topography of the magnetic field does not change with rising magnetic field strength, and 0.3% is given as the maximum deviation of the field on the strength of the particle path. The maximum inhomogeneity is 0.03% per centimeter. Fig. 4 shows the resolving power as a function of the distance of the detector from the point of exit of the particle out of the magnetic field. The best resolution is at 686 mm, which is in good agreement with the projected distance of 700 mm. Fig. 5 shows line shapes of α -particles, as were determined with a scintillation counter

TITLE: Production of thin Al_2O_3 films

PERIODICAL: Pribury i tekhnika eksperimenta, no.6, 1961, 149-150

TEXT: The aim of this work was to produce Al_2O_3 backing films having a thickness of less than 0.1μ for targets evaporated onto them in vacuum. Such targets are suitable for scattering experiments in nuclear physics. The films are prepared as follows. A 40μ aluminium foil is first etched in a 30% solution of NaOH in order to clean the surface from contamination. When a thickness of about 1μ has been reached the foil is oxidized for 2 to 7 min in a bath containing an electrolyte which consists of 1.5% (by weight) of acetic acid and 1.5% of aluminium citrate. The cathodes in the electrolytic bath are two aluminium plates and the foil to be oxidized serves as the anode. The initial current density is varied between 1 and 100 mA and the final oxidation voltage between

E032/E514

10 and 75 V. The oxidized foil is then cut into discs 15-20 mm in diameter and a drop of 30% NaOH solution is placed on one side of each of them. After a few minutes the reaction products are washed off with distilled water and the discs (mounted on stainless steel frames) are placed in a 25% solution of hydrochloric acid which dissolves the aluminium over the section from which Al_2O_3 has been removed. As a result a free transparent film of Al_2O_3 can be obtained. Films 0.015-0.1 μ can be produced in this way. Impurities do not exceed 0.5% relative to the aluminium. TITLE: Elastic and inelastic scattering of protons by Ne^{22} nuclei

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43, no. 3(9), 1962, 749-751

TEXT: Cross sections were measured of elastic (proton energies 1.6-3.2 Mev) and inelastic (1.9-3.2 Mev) scattering, $\text{Ne}^{22}(\text{p},\text{p}\gamma)$, through the angles 90, 125, and 141° in the center-of-mass system, and the angular distribution of the 1.27-Mev γ -rays, using an apparatus described by A. K. Val'ter et al. (Izv. AN SSSR, seriya fiz., 23, 632, 1959) and P. V. Sorokin et al. (ZhETF, 40, 1253, 1961). The neon gas target was enriched to 87% with Ne^{22} . The results of these measurements were evaluated by the method of least squares under the following conditions: The resonance investigated is related to a single level. Only the least possible orbital moments 1 and 1' take part in the reaction. The Ne^{22} ground state has spin and parity 0⁺, the first excited state 2⁺. The

Card 1/2

Elastic and inelastic scattering ...

8/056/62/043/005/002/0.1
8125/0102

γ -transition between 2^+ and 0^+ is a pure $E2$ -transition. In this case, the angular distribution of the inelastically scattered protons can be represented as $1 + \alpha \cos^2 \theta$. The relative intensities of γ -transitions determined from the relative intensities of the peaks in the spectrum of the γ -rays range from 0.12 to 2.66 and the measured widths of these transitions from 15 to 33 keV. The reduced widths Γ_0^2 calculated from the resonance integral are between 2.1 and 225 keV \cdot 10^{-12} $\Gamma_0^2 / \Gamma_{\text{tot}}$. As the proton energy E_{lab} increases from 1.914 to 3.15 MeV the excitation energy of the Na^{23} level increases monotonically from 10.626 to 11.818 MeV. There are 1 figure and 1 table.

ABSTRACT: The described positive polarized deuterium-ion source is similar to an earlier source developed by the authors (Program and Abstracts of Papers of XVI Annual Conference on Nuclear Spectroscopy and Atomic Structure (Moscow, 1966), M., Nauka, 1966, p. 128) but employs a more efficient ionizer, and a higher vacuum is produced through the use of stainless steel and mercury and titanium pumps. The source is based on the principle of spin-sorting the atoms in an inhomogeneous magnetic field with subsequent adiabatic extraction to a weak field region (Fig. 1). Deuterium (or hydrogen) molecules are dissociated in an hf discharge at 150 Mcs. A magnetic field (20 kOe) focuses the atoms with electron spin projections antiparallel to the field, and defocuses the atoms with parallel spins. The focused atomic beam had an intensity 6×10^{15} atoms/sec in a 5 mm diameter, and was ionized by a coaxi-

TITLE: An atomic beam ionizer as a source of polarized ions

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 9, 1966, 1681-1684

TOPIC TAGS: ionizer, polarized ions, polarized ion source, atomic beam ionizer,
electron beam, ionization

ABSTRACT: An ionizer based on the principle of ion focusing as developed and patented earlier by Zinchenko and others, is described in some detail. In this arrangement, the electron beam is coaxial with, instead of perpendicular to, the beam of polarized atoms, thus increasing the ionization length. The electron beam was produced by an electron gun with an oxide cathode 5.5 and 9.6 mm in inner and outer diameter, respectively. The distance from the cathode to the anode was about 7 mm, and from the anode to the collector, 60 mm. The hole diameters in the cathode, anode, and collector were 6, 7, and 8 mm, respectively. An investigation of the characteristics of the device revealed that the transmission factor of the electrons was 100 percent through the anode orifice, and 92 percent through the entire ionizer. The divergence of the electron beam was small, the beam diameter varying between 6 and 8 mm. A hydrogen atom beam produced by the dissociation of molecules in glow-discharge and

Card 1/2

UDC: 539.188

L 44774 06

ACC NR: AP6031272

focused according to atomic spins in a field of a magnetic quadrupole was introduced into the ionizer. The measured efficiency of ionization was found to be 4.5×10^{-4} at a 90-mamp electron current and a 1400-v potential difference between the cathode and anode. The mass-spectrometric data on the composition of the focused atomic beam showed that it consists of hydrogen atoms, thus confirming the stated efficiency of ionization. This efficiency is 3 to 5 times higher than the results reported in the Proceedings of the International Symposium on Polarization Phenomena of Nucleons (Birkhauser Verlag, Basel und Stuttgart, 1961). Orig. art. has: 3 figures and 1 formula. [FP]

TITLE: A source of polarized ions [Report, Sixteenth annual Conference on Nuclear Spectroscopy and Nuclear Structure held at Moscow, 16 Jan. - 3 Feb. 1966]

SOURCE: AN SSSR, Izvestiya. Seriya fizicheskaya, v. 30, no. 12, 1966, 2031-2036

TOPIC TAGS: ion source, hydrogen ion, deuterium, ion beam, proton polarization, deuteron polarization, polarized ion beam

ABSTRACT: The authors describe a source of polarized ions capable of producing a 0.3 μ A beam of polarized deuterons with a polarization tensor component P_{33} of - 0.274. The source can also be employed to produce a beam of polarized protons. In this source the electron spin components in a beam of deuterium atoms are separated in an inhomogeneous magnetic field and the resulting beam of atoms with aligned electron spins is ionized by electron impact. Owing to the coupling between the electron and nuclear spins in the atom, there results a partially polarized beam of deuterons. In the described device deuterium molecules were admitted through a palladium filter to a Pyrex vessel coated on the inside with $(CH_3)_2SiCl_2$ where they were dissociated by the 150 MHz field produced by a 1.5 kW oscillator. The deuterium atoms issued from the dissociation vessel through a microcollimator of glass capillaries and traversed

Card 1/2

ACC NR: AP 7001727

the field of a magnetic quadrupole which focused the component of the beam having the electron spins parallel to the direction of motion and defocused the component having antiparallel electron spins. The polarized atomic beam then traversed the ionizer where the atoms were ionized by impact of electrons moving in the same direction as the atomic beam. The polarized deuteron beam was subsequently accelerated to the desired energy. The ionizer was shielded from fringe fields by a soft steel jacket, and a uniform axial magnetic field was produced within it by a pair of Helmholtz coils. The thermionic cathode and the electron accelerator, focusing, and collector electrodes of the ionizer had central openings for passage of the atomic beam. For a more detailed description of an improved version of this ionizer see abstract AP 7001307. The polarization of the deuteron beam was determined by measuring the angular distribution of neutrons from the $T(d,n)He^4$ reaction at the 107 keV $3/2^+$ resonance. The authors thank A.P.Klyucharev for assistance and support, and B.P.Ad'yasevich for providing the microcollimators. Orig. art. has: 6 formulas and 7 figures.

Title : Mutual Connection Between Saturation Pressure and Enthalpy of Water near Boiling Point.

Orig Pub : Izv. Kiyevsk. politekh. in-ta, 1956, 17, 109-111

Abstract : An empirical formula connecting the enthalpy i_g' of the saturated water steam with its pressure $p_g = (i_g' / 98.4)^{3.5}$ is proposed. This formula guarantees a sufficient exactitude near the boiling point, in the zone of excess pressure, and in the zone of rarefaction (the error at 0.305 to 3.68 abs. atm. is $\leq 5\%$, between 0.355 and 2.97 abs. atm. it is $\leq 3\%$).

TITLE: On Interrelation between the Pressures before and after the Steam Turbine Compartment and the Weight Flow of Steam through the Compartment (O vzaimosvyazi mezhdu davleniyami do i posle paroturbinnogo otseka i raskhodom para cherez otsek)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Energetika, 1959, Nr 1, pp 41-47 (USSR)

ABSTRACT: A steam turbine compartment is, in this article, a group of turbine stages connected in series. The calculation for variable operating conditions deals with the weight flow of steam (D , t/hr), pressure before the compartment (p_1 , atm absolute pressure) and pressure after the compartment (p_2 , atm absolute pressure) in order to determine one of these values when the other two are specified. The Flügel (Stodola) formulae

Card 1/4 $\frac{D}{D_0} = \frac{p_1}{p_{01}} \sqrt{\frac{T_{01}}{T_1}}, \quad \frac{D}{D_0} = \sqrt{\frac{p_1^2 - p_2^2}{p_{01}^2 - p_{02}^2}} \sqrt{\frac{T_{01}}{T_1}}$

SOV/143-59-1-7/17

On Interrelation between the Pressures before and after the Steam Turbine Compartment and the Weight Flow of Steam through the Compartment

apply, respectively, to supercritical and subcritical conditions and cover only multistage compartments with no less than four stages. A general expression, applying to multistage compartments as well as to compartments with few stages in both supercritical and subcritical conditions, was found by A.V. Shcheglyayev, who also offered its graphic interpretation: the surface of an oblique conoid with an adjoining flat triangle of supercritical conditions. Because of its complexity, A.V. Shcheglyayev's formula was little used. In 1954, the author modified it to make its application more convenient; but it still remained rather heavy. It has been established that the law of variable operating conditions of the steam turbine compartment can be expressed by the

Card 2/4

formula

$$\frac{D\sqrt{P_1 V_1}}{P_1 \Phi(\beta)} = \text{const},$$

where $\beta = P_2/P_1$ and $\Phi(\beta)$ = interrelation between the

SOV/143-59-1-7/17

On Interrelation between the Pressures before and after the Steam Turbine Compartment and the Weight Flow of Steam through the Compartment

weight flow of steam through the compartment and the pressure ratio, which is elliptic in character. By selecting a proper scale, the elliptic function can be reduced to an arc of a circle, which permits to express the value Φ (β) by a trigonometric function. As a result, the following formula is offered for calculations:

$$\frac{D}{D_{01}} = \frac{p_1 \sin \varphi}{p_{01} \sin \varphi_0} \sqrt{\frac{p_{01} v_{01}}{p_1 v_1}}$$

The specific volume of steam, which constitutes a value necessary for the calculation of a turbine stage or compartment, can be easily determined by the use of an "is" diagram with $pv = \text{const}$ lines. There are 2 diagrams and 8 Soviet references.

Orig Pub: Dyall Nauchno-tekhn. Inform. N.-1. in-to Pchelovodstva, 1957, No 2, 3-7.

Abstract: It has been concluded on the basis of tests made at 13 apiaries in 7 oblasts with 722 colonies, one half of which were cross breeds, together with observations made at 80 apiaries containing 1274 families that the cross breeds collect an average of 30% more honey than the colonies of local bees. The cross-

 ABSTRACT : From practical observations by many apicul-
 turists who wrote to the editor, a conclusion
 is drawn that Butler's theory on the signi-
 ficance of the royal jelly cannot explain all
 the facts in honeybee life which pertain to
 the formation of the queen cells and the
 change of queens. In the relations between
 the queen and honeybees, apart from royal
 jelly, the queen's odor, her physiological
 condition and the character of egg laying
 also play a role.

TOPIC TAGS: binary code, code converter, computer component, *semiconductor device*

ABSTRACT: The author describes a simple converter for the transformation of consecutive binary codes into decimal codes. The unit, developed at the L'vov Polytechnic Institute (L'vovskiy politekhnicheskii institut), for the multichannel code-pulse system of remote measurements is built from semiconductor elements and is based on the representation of the binary code by series of pulses denoting decimal digits. The main component of the converter is a pulse multiplier made of series stages operating under switching conditions, supplemented by triggering inputs sensitive to the number of binary discharges and by an "OR" element collecting the stage outputs. TITLE: A multichannel pulse-code telemetry system for data units with a frequency-unified parameter

SOURCE: AN UkrSSR. Metody otbora i peredachi informatsii (Methods of selecting and transferring information). Kiev, Naukova dumka, 1965, 134-143

TOPIC TAGS: telemetry system, telemetry transmitter, telemetry receiver, pulse coding, pulse code modulation

ABSTRACT: A telemetry system for the simultaneous measurement of a number of data values is described. The frequencies are pulse-binary coded and transmitted along communication lines. The system consists of a transmitter and receiver. The transmitter links the outputs of the data units, quantizes and codes the frequencies in binary form, transforms the parallel binary code into a sequential code for transmission along a single line, shapes the code pulses, and rounds off the number of code pulses to an even value to prevent distortion. The receiver transforms the sequential binary code into a parallel code and makes a parity check. The receiver also indicates the number of the data unit along the sequence with the measured value and stores the data be-

Card 1/2

tween reception intervals. The main advantages of using frequency as a unified parameter are: greater precision of measurement, easier change of scale, elimination of distortion during communication, and ease of translation into any other code. Detailed schematic diagrams of both the transmitting and receiving systems are presented and an explanation of the operation of various parts is given. The error of the system, excluding errors introduced by the data units, may be reduced to 0.2%. Orig. art. has: 3 figures.

TITLE: Serial binary-code decoder with a scaling unit

SOURCE: Lvov. Politekhnicheskii institut. Kontrol'no-izmeritel'naya tekhnika (Control and measurement techniques), no. 2. Lvov, Izd-vo L'vov. univ., 1966, 92-95

TOPIC TAGS: telemetry equipment, code converter, binary decimal converter, *CODE EVALUATION, BINARY CODE*

ABSTRACT: A decoder unit for use in PCM telemetry systems is described which converts serial binary data representing measured quantities in relative units to decimal data in absolute units. The time division multiplex telemetry decoder (see Fig. 1) consists of a binary-to-decimal code converter and a scaling unit. An 8-bit binary number is converted to its decimal equivalent by the following principle. Each binary bit triggers a multiphase monostable circuit which issues a pulse train wherein the number of pulses equals the decimal equivalent of the binary bit. The scaling factor register unit sets the flip-flops T_1 - T_5 into positions which determine one of ten scaling factors. The scaling factors determine the number of times the multiphase monostable output pulse train is repeated during its transmission to

TARANOV, M. T.

1 Nitrogenous substances in the blood plasma of horses at different ages. M. T. Taranov. *Konovolstro* 1953, No. 4, 28-30; *Referat. Zhur. Akad. Nauk* 1953, No. 6813. — Nitrogenous substances in the blood plasma were studied in 129 healthy horses at ages of 3 days to 19 years. The horses were pasture fed without supplemental feeding. It was found that as the animal grows, the contents of some nitrogenous fractions change, the most intense changes occur during the first year of the animal's life and are completed at the age of three. During this period the total N content in colts increases from 1027 to 1230 mg. % and in fillies from 976.4 to 1436.3 mg. %, the content of protein N changes accordingly from 697 to 1203.6 mg. % and from 945.6 to 1403.2 mg. %, and the concn. of protein from 6.23 to 7.66% in colts and from 5.91 to 8.77% in fillies. The residual N does not change appreciably and the concn. of amino N in the plasma filtrate decreases on an av. of from 9.6 to 7.23%.
M. Huseh
